## What is G5 Food Expenditure?

G5 Food Expenditures is a data file providing detailed and summary information on food expenditure by household. Food items purchased from stores and meals bought from restaurants are presented separately. Summary food items purchased from stores include: fresh and frozen meat and poultry; fish; dairy products - milk, cheese; eggs; bakery and cereal products - bread, cookies, cakes; pasta products; breakfast cereal; fresh fruit; other prepared fruit; fresh vegetables; other prepared vegetables; condiments; sugar; coffee and tea; fats and oils; other prepared foods - soups, potato chips; and non-alcoholic beverages. Also, total food purchased from stores is shown by type of store - supermarkets, food specialty stores, convenience stores and other stores. Meals purchased from restaurants are presented as follows: breakfasts, lunches, dinners and between-meals food.

It includes values for approximately 300 variables, and each variable is reported both in average dollars spent per household and total expenditure dollars. Projected to the six-digit postal code, this database is divided into four main categories:

- Food purchased locally and on day trips
- Purchase channels
- Restaurant food purchases
- Totals

## Methodology

Statistics Canada conducts a survey which was carried out in private households in urban and rural areas in Canada's 10 provinces as well as in the cities of Whitehorse, Yellowknife and Iqaluit. This survey covers about 98% of the population in the 10 provinces. The survey provides estimates of food expenditures and quantities purchased by households. Throughout the year people were asked to record their expenditure on food and other selected items for a period of 2 weeks.

Constructed by applying Generation5's Mathematical Technologies™, Generation5's G5 Food Expenditures micro marketing database provides unprecedented refinement in demographic and socio-economic data. G5 Food Expenditures is comprised of Census variables modeled at the postal code level.

Generation5 performs a set of complex calculations based on several integrated data inputs, and on derived geographic linkages, in order to model Census variables at the postal code level. The advanced mathematical technology applied to create G5 Food Expenditures involves techniques employing the theory of machine learning using several integrated data inputs as a training set. In particular, a scenario based, non-parametric, non-linear approach is adopted. G5 Food Expenditures is produced using a sophisticated set of proprietary data-mining technologies, including a feature-selection/data-reduction module (VIVa) and a prediction/classification module (MWM).

Generation5's innovative Feature Selection methodology automatically selects the most relevant features (independent variables), eliminates erroneous and redundant features and significantly improves the accuracy of subsequent prediction algorithms.

---

<sup>2</sup> Total of 580 variables, variables modeled at average dollars spent per household and total expenditure dollars.

Generation5's proprietary prediction methodologies are sophisticated algorithms that generate estimates for a target (dependent) variable based on a historical record, and a set of independent variables.

## **About Generation5**

Generation5 builds effective consumer marketing solutions for some of North America's largest organizations and most recognized brands. Generation5's suit of products and services include enterprise-wide analytical projects for F500 customers, data mining software development, data production and Automated Analytical Outsource Services for organizations seeking fast solutions to recurring challenges.
